## Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-11, 18-34 are rejected under 35 U.S.C. 103(a) as being unpatentable over Davis (U.S. 5838678) in view of Ejiri (U.S. 6262990 B1).
- 3. Regarding claims 1, Davis teaches (col. 9, line 50 col. 10, line 50) an information processing apparatus comprising: input means (fig. 9, elements 902, 908) for inputting variable length packet data (video data, audio data) including packet length information indicative of a packet length and encoded information data; judgment means (906) for judging the packet length of the variable length packet data (col. 9, lines 64-67); and packet generating means (914) for generating said variable length packet data into fixed length packet data in accordance with an output of said judgment means, and transmitting the fixed length packet data (col. 10, lines 1-7), wherein the packet generating means includes memory means for generating fixed-length data, the memory means is initialized by writing stuffing data into in advance (col. 10, lines 30-38), and the packet generating means generates the fixed length data by writing the variable length packet data into the initialized memory means in accordance with the packet length judged by the judgment means and reading out the data from the memory means (figs. 9 and 14).

Art Unit: 2665

4. Davis does not teach the packet generating means generates the fixed length packet data to which the stuffing data is added, in case that the variable length packet data to be written into the memory means is shorter than a predetermine length.

- 5. Ejiri teaches (col. 3, lines 8-34) generating means generates the fixed length packet data to which the stuffing data is added, in case that the variable length packet data to be written into the memory means is shorter than a predetermine length (col. 5, lines 23 41). It would have been obvious to one of ordinary skill in the art to adapt to Davis' system Ejiri's stuffing function to compensate for the shortened length.
- 6. Regarding claim 2. Davis teaches (col. 10 and col. 11, lines 4-10) a clock reference information generating means for use in a time reference during decoding of encoded data.
- 7. Regarding claim 3, Davis teaches (col. 11, line 61-63) program specific information included in the data.
- 8. Regarding claim 4, Davis teaches (figure 9) the input means inputs a plurality of types of variable length packet data.
- 9. Regarding claim 5, Davis teaches (col. 11, lines 4-10) the packet generating means transmits the fixed length packet data provided with the clock reference information, when no effective fixed length packet data is present.

Art Unit: 2665

10. Regarding claim 6, Davis teaches (col. 11, line 61-63) transmitting the fixed length packet data provided with the program specific information, when no effective fixed length packet data is present.

- 11. Regarding claims 7, 19 and 23, Davis teaches (col. 1, lines 21-44 and figure 9) the variable length packet data is PES (906) conforming to ISO/IEC 13818-1, and the fixed length packet data is TS (914) conforming to ISO/IEC 13818-1.
- 12. Regarding claims 8 and 20, Davis teaches (col. 1, lines 21-44 and col. 11, lines 1-10) the clock reference information is PCR conforming to ISO/IEC 13818-1.
- 13. Regarding claims 9 and 24, Davis teaches (col. 1, lines 21-44 and col. 11, line 61-63) the program specific information is PSI conforming to ISO/IEC 13818-1.
- 14. Regarding claims 10, 21 and 25, Davis teaches (col. 1, lines 21-44 and col. 9) the information data is image data, and is encoded in conformity with ISO/IEC 13818-2
- 15. Regarding claim 11, Davis teaches (fig. 1, element 136) inserting a stuffing byte when the code length of the variable length packet is less than the code length, which can be inserted into the fixed-length packet

Art Unit: 2665

16. Regarding claim 18, Davis teaches (col. 9, line 50 – col. 10, line 50 and figures 9 an 14) an information processing apparatus comprising: generating means for generating variable-length packets including encoded information (906); generating means (914) for generating and transmitting fixed-length packet data from the variable length packets; and generating means for generating clock reference information (col. 11, lines 4-10) for use in a time reference during decoding.

- 17. Davis does not teach the second generating means operates within a predetermined time interval and transmits the second fixed length data regardless of the predetermined time interval when there is no effective first fixed length packet data.
- 18. Ejiri teaches (fig. 4) the second generating means operates within a predetermined time interval and transmits the second fixed length data regardless of the predetermined time interval when there is no effective first fixed length packet data. It would have been obvious to one of ordinary skill in the art this adapt to Davis's system to avoid collision or interference in the system.
- 19. Regarding claim 22, Davis teaches (col. 9, line 50 col. 10, line 50 and figures 9 an 14) an information processing apparatus comprising: first generating means (904) for generating variable length packet data including encoded information data; second generating means (914) for generating and transmitting first fixed length packet data from the variable length packet data generated by the first generating means; and generating means for generating program specific information (col. 11, lines 61-67) indicative of a program specific of the first fixed length packet data.

Art Unit: 2665

20. David does not teach the second generating means operates within a predetermined time

interval and transmits the second fixed length data regardless of the predetermined time interval

when there is no effective first fixed length packet data.

21. Ejiri teaches (fig. 4) the second generating means operates within a predetermined time

interval and transmits the second fixed length data regardless of the predetermined time interval

when there is no effective first fixed length packet data. It would have been obvious to one of

ordinary skill in the art this adapt to Davis's system to avoid collision or interference in the

system.

22. Regarding claim 26, Davis teaches (col. 9, line 50 – col. 10, line 50 and figures 9 an 14)

an information processing method comprising: inputting variable length packet data including

packet length information indicative of a packet length and encoded information data; judging

the packet length of the variable length packet data (col.9, lines 50-67); generating said variable

length packet data into fixed length packet data in accordance with an output of said judgment

means, and transmitting the fixed length packet data (col. 10, lines 1-7), wherein the generating

step includes initializing memory means for generating fixed-length data, by writing stuffing

data into in advance (col. 10, lines 30-38), and generating step generates the fixed length data by

writing the variable length packet data into the initialized memory means in accordance with the

packet length judged in the judging step and reading out the data from the memory means (figs. 9

and 14).

Art Unit: 2665

23. Davis does not teach the packet generating the fixed length packet data to which the stuffing data is added, in case that the variable length packet data to be written into the memory means is shorter than a predetermine length.

- 24. Ejiri teaches (col. 3, lines 8-34) generating the fixed length packet data to which the stuffing data is added, in case that the variable length packet data to be written into the memory means is shorter than a predetermine length (col. 5, lines 23 41). It would have been obvious to one of ordinary skill in the art to adapt to Davis' system Ejiri's stuffing function to compensate for the shortened length.
- 25. Regarding claim 27, Davis teaches (col. 9, line 50 col. 10, line 50 and figures 9 an 14) a information processing method comprising: generating variable length packets included encoded information data (906); generating and transmitting first fixed length packet data (video) from variable length data (914); and generating clock reference information for use in a time reference (col. 11, lines 4-10) during decoding of the encoded information.
- 26. Davis does not teach the fixed length generating step includes a step of generating second fixed length packet data including the clock reference information and transmitting it within a predetermined time interval, and a step of compulsorily transmitting it when there is no effective first fixed length packet the second fixed length regardless of the predetermined time interval.
- 27. Ejiri teaches (fig. 4) generating second fixed length packet data including the clock reference information and transmitting it within a predetermined time interval, and a step of compulsorily transmitting it when there is no effective first fixed length packet the second fixed

Art Unit: 2665

length regardless of the predetermined time interval. It would have been obvious to one of ordinary skill in the art this adapt to Davis's system to avoid collision or interference in the system.

- 28. Regarding claim 28, Davis teaches (col. 9, line 50 col. 10, line 50 and figures 9 an 14) a information processing method comprising: generating variable length packets included encoded information data (col. 9, lines 50-67); generating and transmitting first fixed length packet data (video) from variable length data (col. 10, lines 1-10); and generating program specific information (MPEG) indicative of a program specific of the first fixed length packet (col. 11, lines 61-67).
- 29. Davis does not teach the fixed length generating step includes a step of generating second fixed length packet data including the program specific information and a step of transmitting it within a predetermined interval, and a step of compulsorily transmitting it regardless of the predetermined time interval when there is no effective first fixed length packet data.
- 30. Ejiri teaches (fig. 4) generating second fixed length packet data including the program specific information and a step of transmitting it within a predetermined interval, and a step of compulsorily transmitting it regardless of the predetermined time interval when there is no effective first fixed length packet data. It would have been obvious to one of ordinary skill in the art this adapt to Davis's system to avoid collision or interference in the system.

Art Unit: 2665

31. Regarding claim 29-31, Davis teaches (column 10 and figure 9) a storage medium for storing information processing program and read by a computer.

- 32. Regarding claims 32, Davis teaches (col. 9, line 50 col. 10, line 50) an information processing apparatus comprising: input portion (fig. 9, elements 902, 908) for inputting variable length packet data (video data, audio data) including packet length information indicative of a packet length and encoded information data,; judgment portion (906) for judging the packet length of the variable length packet data (col. 9, lines 64-67); and packet generating portion (914) for generating said variable length packet data into fixed length packet data in accordance with an output of said judgment means, and transmitting the fixed length packet data (col. 10, lines 1-7), wherein the packet generating portion includes memory means for generating fixed-length data, the memory means is initialized by writing stuffing data into in advance (col. 10, lines 30-38), and the packet generating means generates the fixed length data by writing the variable length packet data into the initialized memory means in accordance with the packet length judged by the judgment means and reading out the data from the memory means (figs. 9 and 14).
- 33. Davis does not teach the packet generating means generates the fixed length packet data to which the stuffing data is added, in case that the variable length packet data to be written into the memory means is shorter than a predetermine length.
- 34. Ejiri teaches (col. 3, lines 8-34) generating means generates the fixed length packet data to which the stuffing data is added, in case that the variable length packet data to be written into the memory means is shorter than a predetermine length (col. 5, lines 23 41). It would have

Art Unit: 2665

been obvious to one of ordinary skill in the art to adapt to Davis' system Ejiri's stuffing function to compensate for the shortened length.

- 35. Regarding claim 33, Davis teaches (col. 9, line 50 – col. 10, line 50 and figures 9 an 14) an information processing apparatus comprising: generating portion for generating variablelength packets including encoded information (906); generating portion (914) for generating and transmitting fixed-length packet data from the variable length packets; and generating portion for generating clock reference information (col. 11, lines 4-10) for use in a time reference during decoding.
- 36. Davis does not teach the second generating portion operates within a predetermined time interval and transmits the second fixed length data regardless of the predetermined time interval when there is no effective first fixed length packet data.
- 37. Ejiri teaches (fig. 4) the second generating portion operates within a predetermined time interval and transmits the second fixed length data regardless of the predetermined time interval when there is no effective first fixed length packet data. It would have been obvious to one of ordinary skill in the art this adapt to Davis's system to avoid collision or interference in the system.
- 38. Regarding claim 34, Davis teaches (col. 9, line 50 – col. 10, line 50 and figures 9 an 14) an information processing apparatus comprising: first generating portion (904) for generating variable length packet data including encoded information data; second generating portion (914) for generating and transmitting first fixed length packet data from the variable length packet data

Art Unit: 2665

generated by the first generating portion; and generating portion for generating program specific information (col. 11, lines 61-67) indicative of a program specific of the first fixed length packet data.

- 39. Davis does not teach the second generating portion operates within a predetermined time interval and transmits the second fixed length data regardless of the predetermined time interval when there is no effective first fixed length packet data.
- 40. Ejiri teaches (fig. 4) the second generating portion operates within a predetermined time interval and transmits the second fixed length data regardless of the predetermined time interval when there is no effective first fixed length packet data. It would have been obvious to one of ordinary skill in the art this adapt to Davis's system to avoid collision or interference in the system.

## Conclusion

- 41. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).
- 42. A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event,

Art Unit: 2665

however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

43. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Roberta A Stevens whose telephone number is 571-272-3161. The examiner can normally be reached on M-F 9:00am-5:30pm.

- 44. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Huy Vu can be reached on 571-272-3155. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
- 45. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
